

Change Log:

V1.2.0

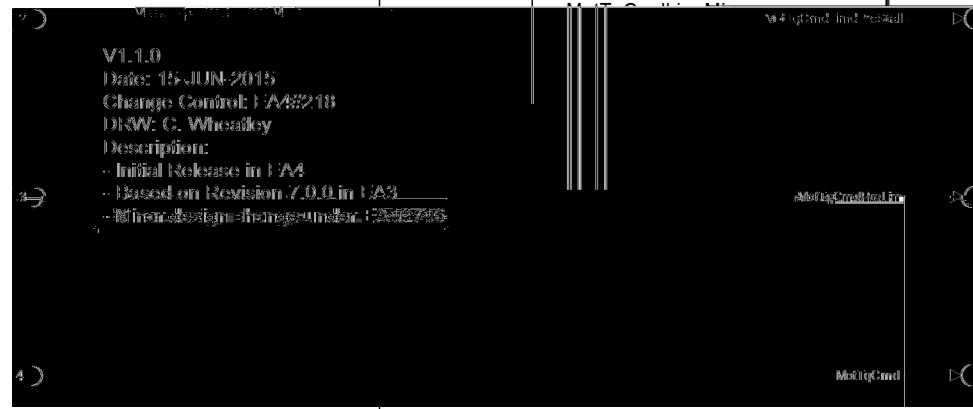

Date: 15JUL2015

Change Control: EA4#1123

DRW: C. Wheatley

Description:

- EnglNit values changed for:
  - SysMotTqCmdSca
  - ThermMotTqLim

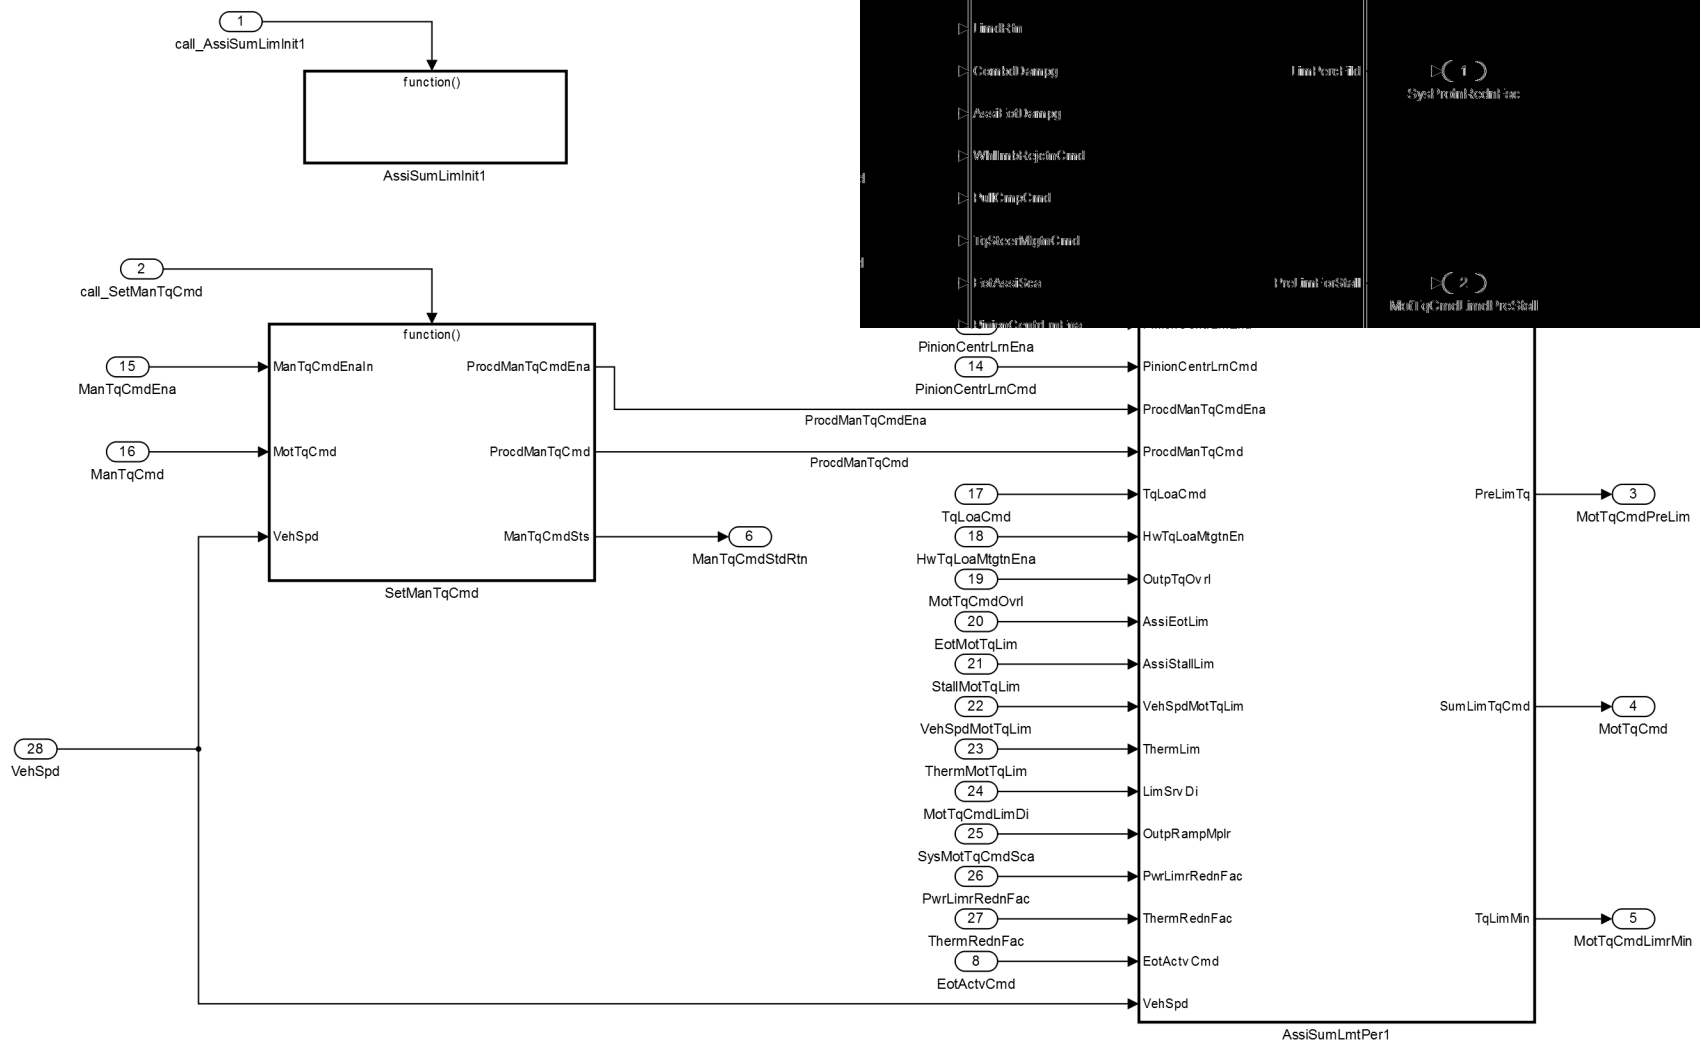

For Simulation Purposes

SF-04B Assist Summation and Limiting (Current)  
v7.0.0 Date: 19-Feb-2015

This function sums torque commands from various functions and then limits the net command. Before summation, it allows for application of safety overwrites of incoming signal values.

f()

function

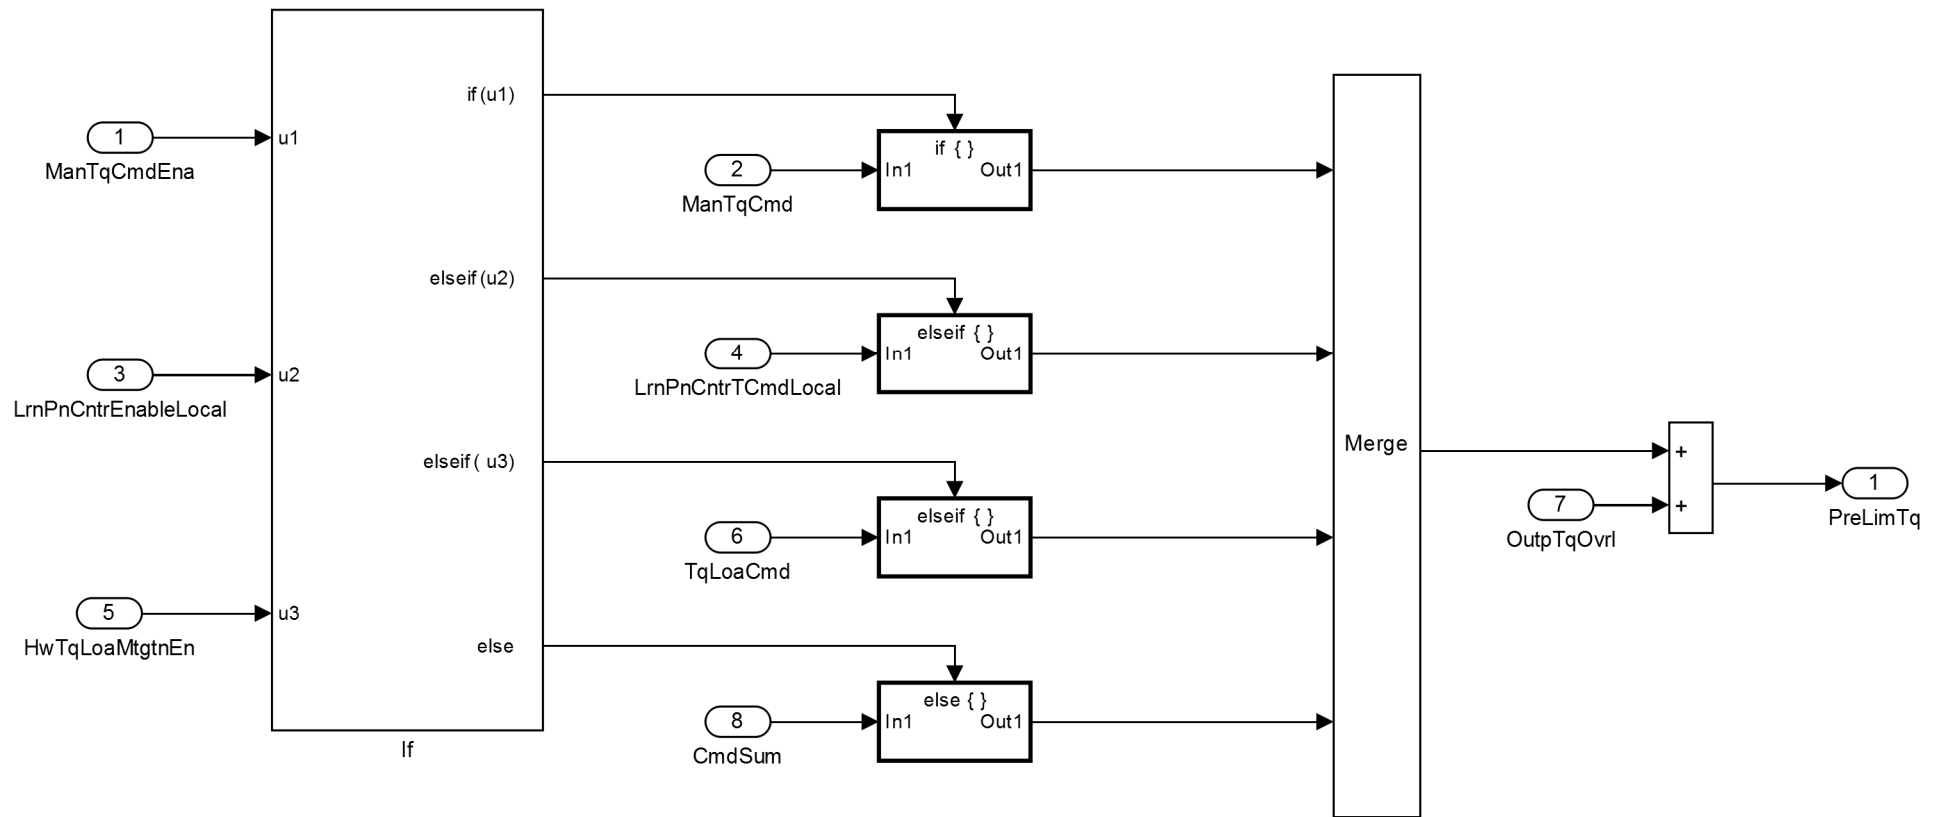

Nexteer Confidential -- ©2014- 2015 Nexteer

This component monitors Learn Pinion Center signals for safety violations, and sets a Nexteer Trouble Code when a violation persists.

This initialization runnable calls DiagMgr to set the NIC status to Pass.

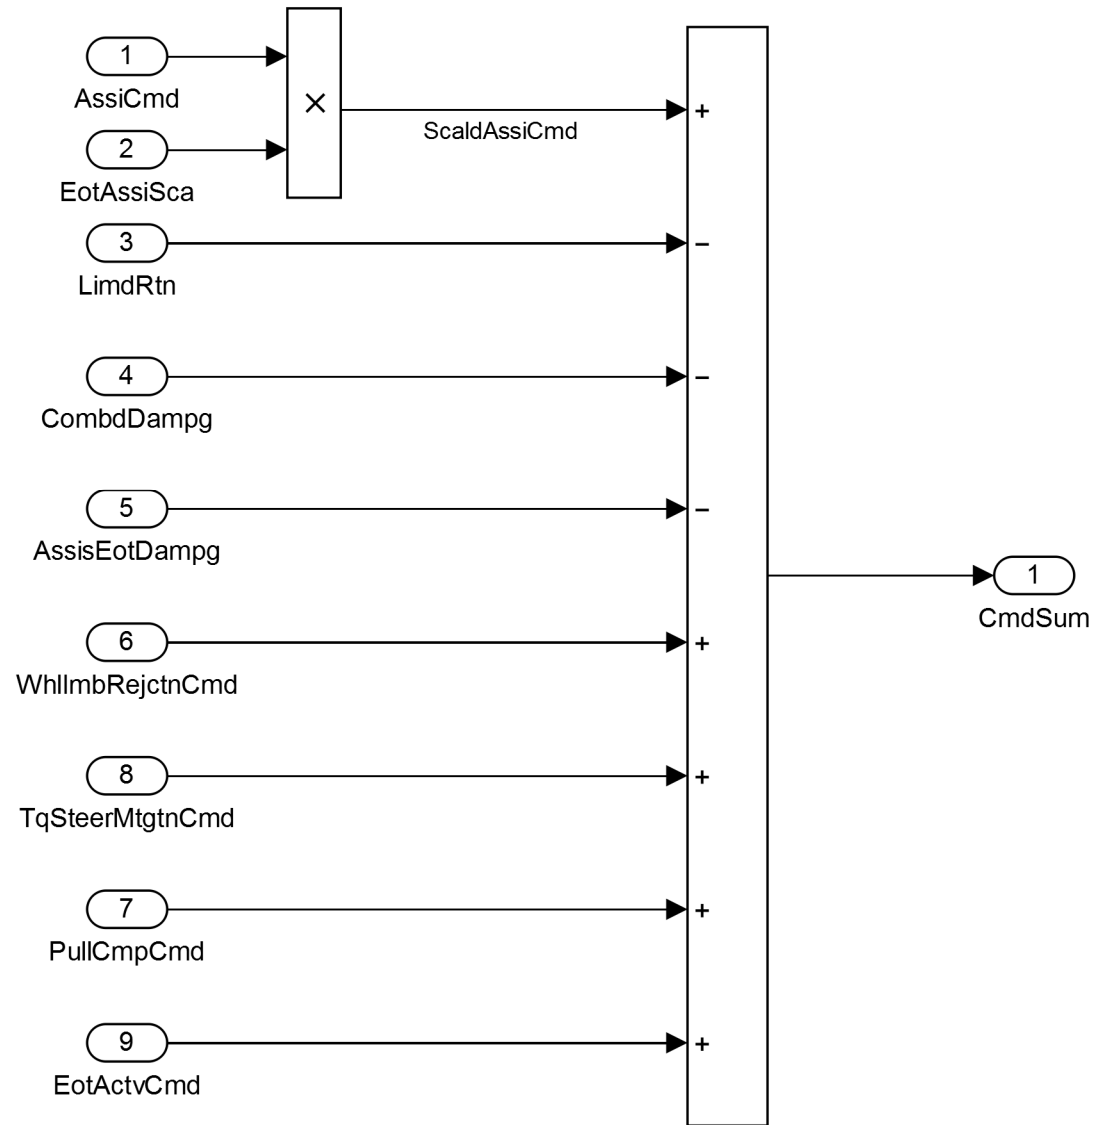

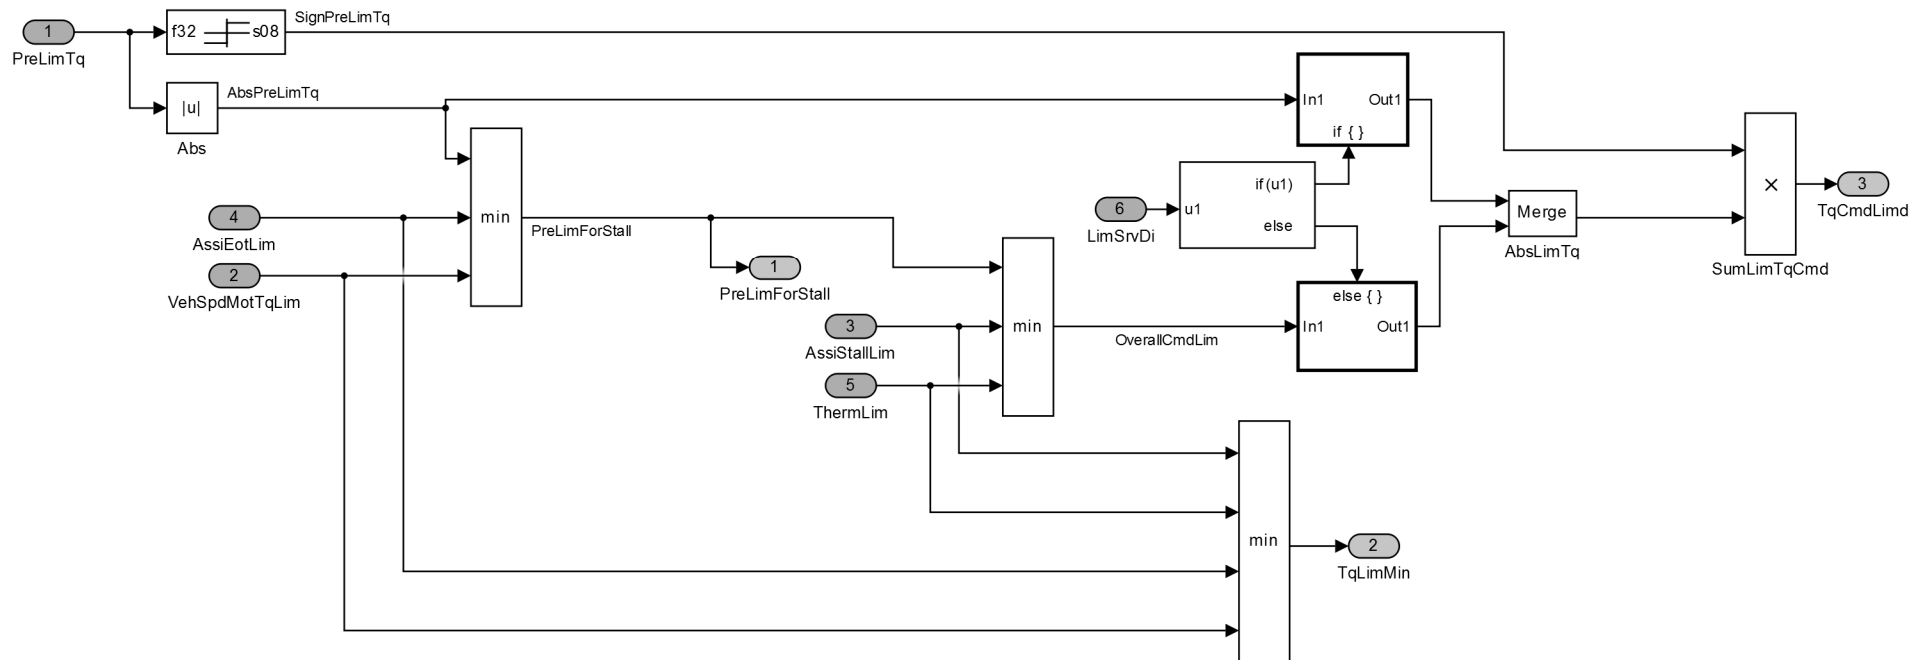

This block applies an overall limit to the previous summation while outputting intermediate calculations along the way.

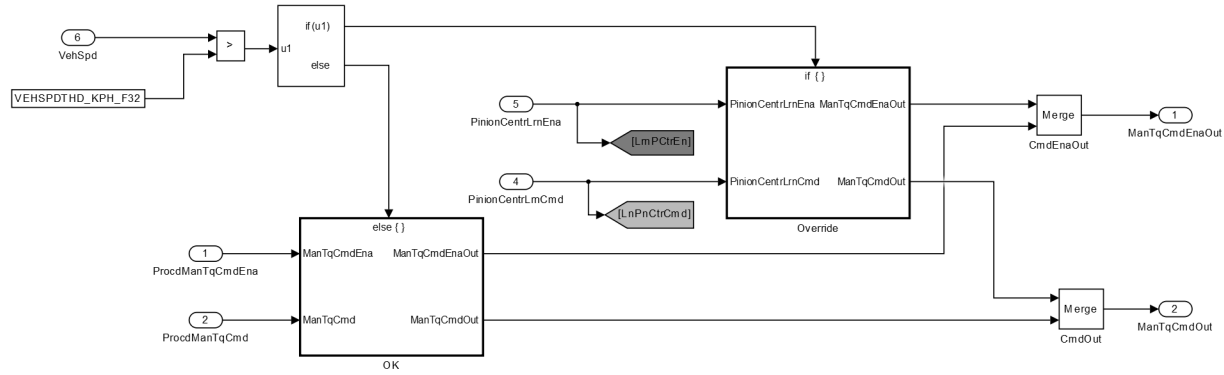

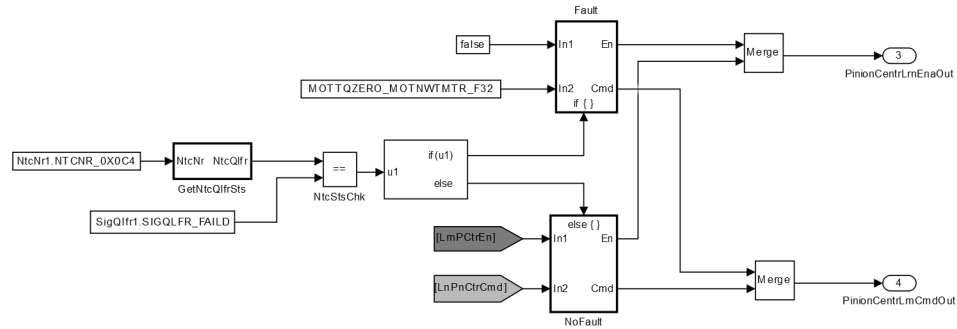

This routine applies safety-related conditioning to incoming signals. These operations are performed within this software component because it is intended to support ASIL-D. The components providing the inputs have lower ASIL ratings.

### Manual Torque Command and Learn Pinion Center

### Get NTC Qualifier Status to set Pinion Center Enable Out and Pinion Center Command Out

### Pull Compensation

### Torque Steer Mitigation

Action Port

else { }

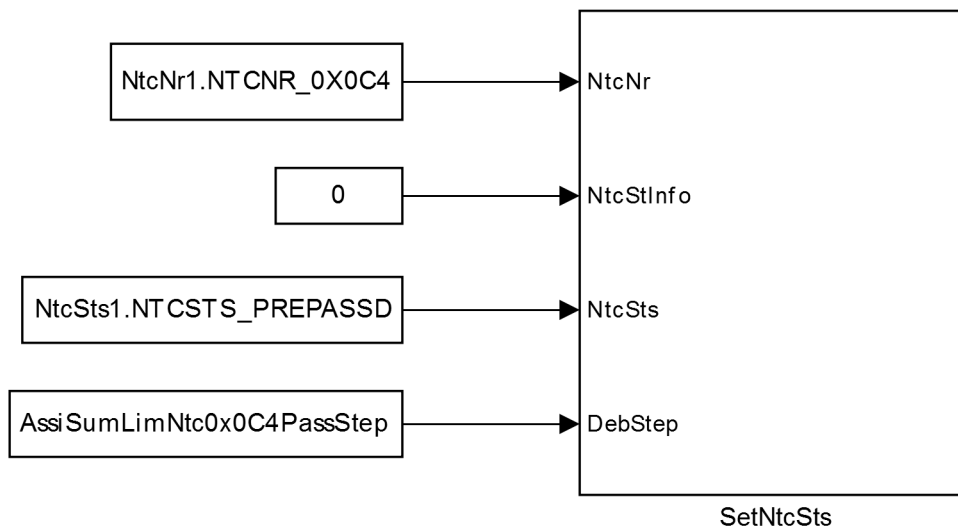

Action Port

Nexteer Confidential -- ©2014- 2015 Nexteer

When Vehicle Speed is lesser than thershold, pass on Manual Torque Command Enable and Manual Torque Command values

When vehicle Speed is lesser than threshold, NTC status is set to PREPASSED irrespective of PinionCentrLrnEna and PinionCentrLrnCmd values

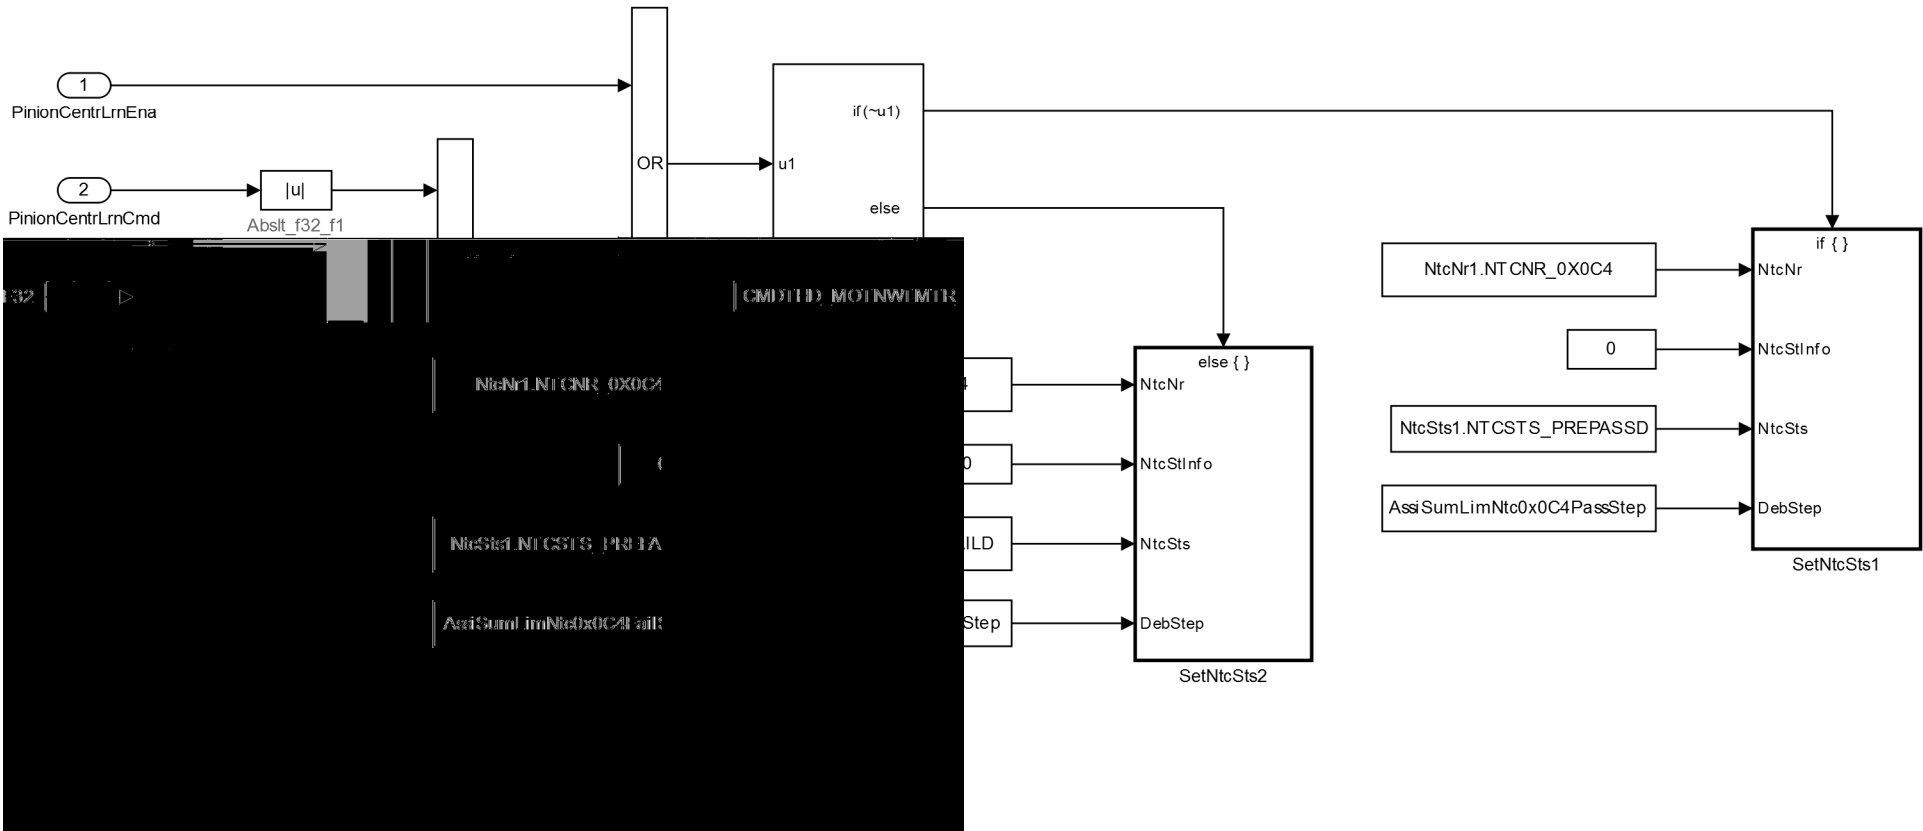

if {}  
Action Port

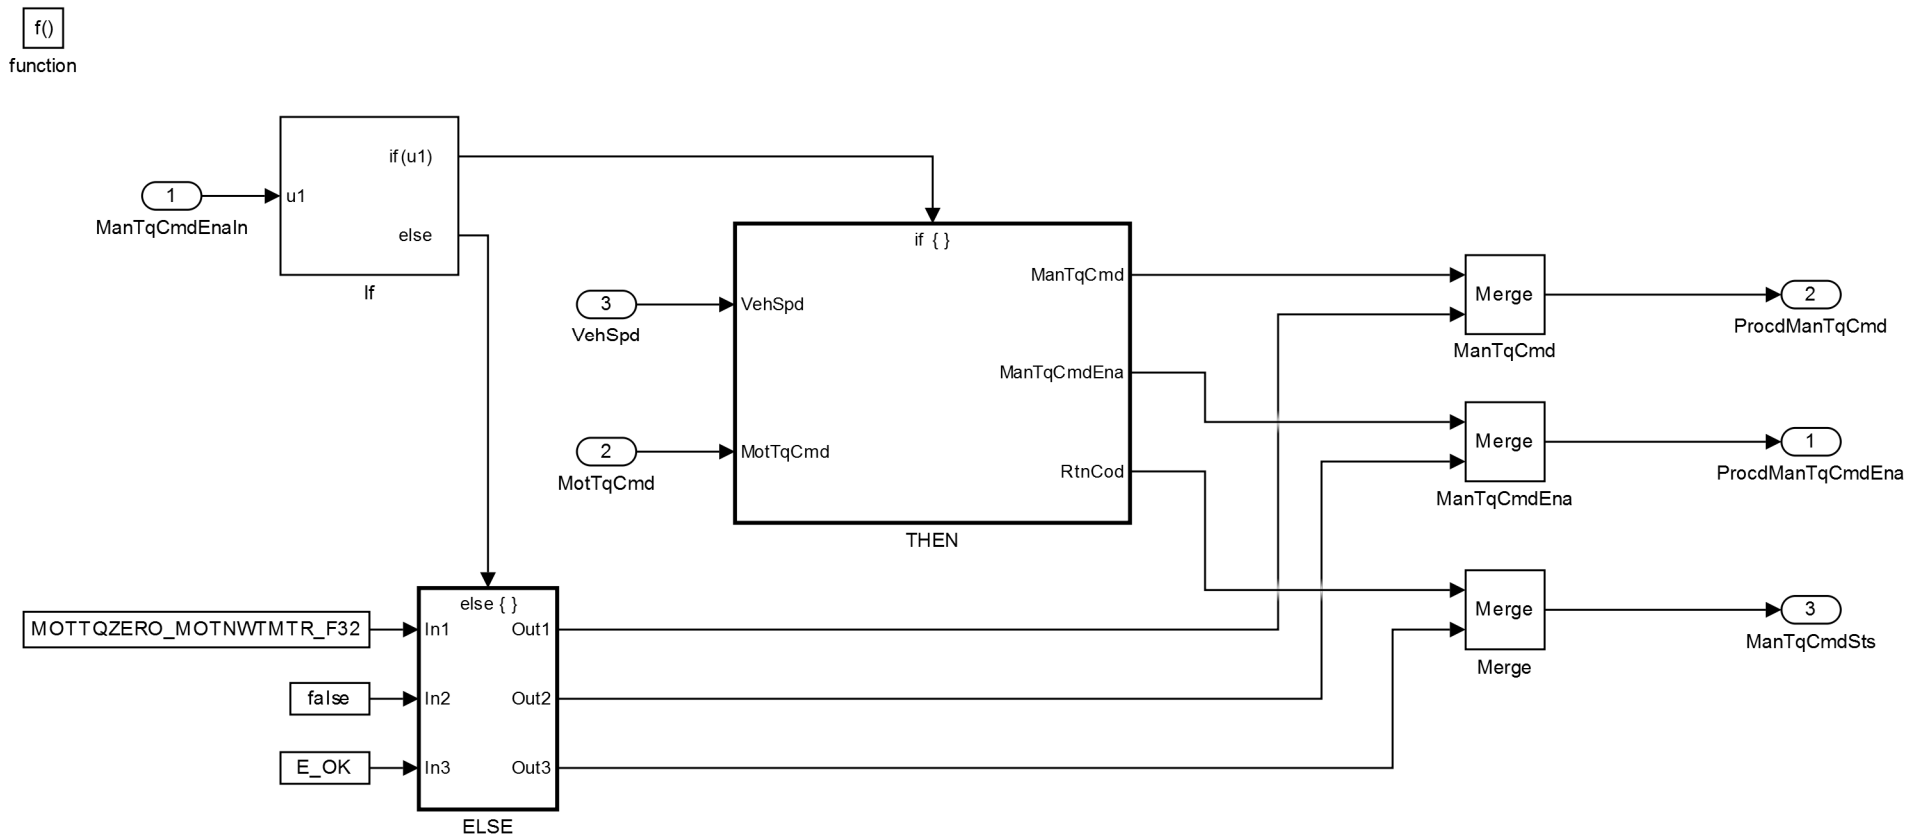

When Vehicle Speed is greater than threshold, set Manual Torque Command Enable Out to False and Manual Torque Command Out to 0

When Vehicle Speed is greater than threshold, learn Pinion Center Enable and Pinion Center Command to set NTC status.

This model writes to two module-level static variables visible to Periodic1 runnable. It only takes a snapshot of vehicle conditions. It may allow a requested enable and return an error code of "OK", but the periodic it feeds must continuously watch for the possibility of vehicle rolling while enabled.
